ABSTRAK

Dislogia salah satunya adalah karena problem psikososial atau akibat dari *Autism Spectrum Disorder* (ASD). *Autism Spectrum Disorder* (ASD) adalah gangguan yang ditandai dengan defisit dalam komunikasi sosial dan interaksi sosial serta adanya perilaku yang terbatas dan berulang. Adapun tujuan dari studi kasus ini adalah untuk mengetahui apakah metode *Discrete Trial Training* (DTT) dapat meningkatkan kemampuan pemahaman pada klien ASD dalam 6 sesi selama 30 menit per sesi. Diperoleh hasil *pretest* dengan total skor yaitu 0, sedangkan untuk hasil *posttest* diperoleh total skor 2. Sehingga berdasarkan hasil tersebut dapat disimpulkan bahwa metode *Discrete Trial Training* (DTT) dapat digunakan untuk meningkatkan kemampuan pemahaman pada klien Dislogia Psikososial (*Autism Spectrum Disorder*). Program terapi dilanjutkan secara *continue*.

ABSTRACT

One of the dyslogias is due to psychosocial problems or the result of Autism Spectrum Disorder (ASD). Autism Spectrum Disorder (ASD) is a disorder characterized by deficits in social communication and social interaction as well as limited and repetitive behavior. The purpose of this case study is to find out whether the Discrete Trial Training (DTT) method can improve the comprehension skills of ASD clients in 6 sessions of 30 minutes per session. The pretest results obtained with a total score of 0, while the posttest results obtained a total score of 2. So based on these results it can be concluded that the Discrete Trial Training (DTT) method can be used to improve understanding skills in clients with Psychosocial Disorder (Autism Spectrum Disorder). The therapy program is continued continuously.
