***ABSTRACT***

Specific Language Impairment (SLI) is a child with certain disorders who fail to develop age-appropriate language despite appearing normal in other respects. The purpose of this case study is to improve sentence-level expressive language skills in girls with SLI diagnosis aged 5 years 1 month with the Expansions method. Pretest results were obtained with a total score of 2 1/2, while for posttest results a total score of 5 1/2 was obtained. So based on these results, it can be concluded that the Expansions method can be used to improve sentence-level expressive language skills in Specific Language Impairment (SLI) clients. The therapy program is continued.
